

STUDENT VIOLATION SYSTEM

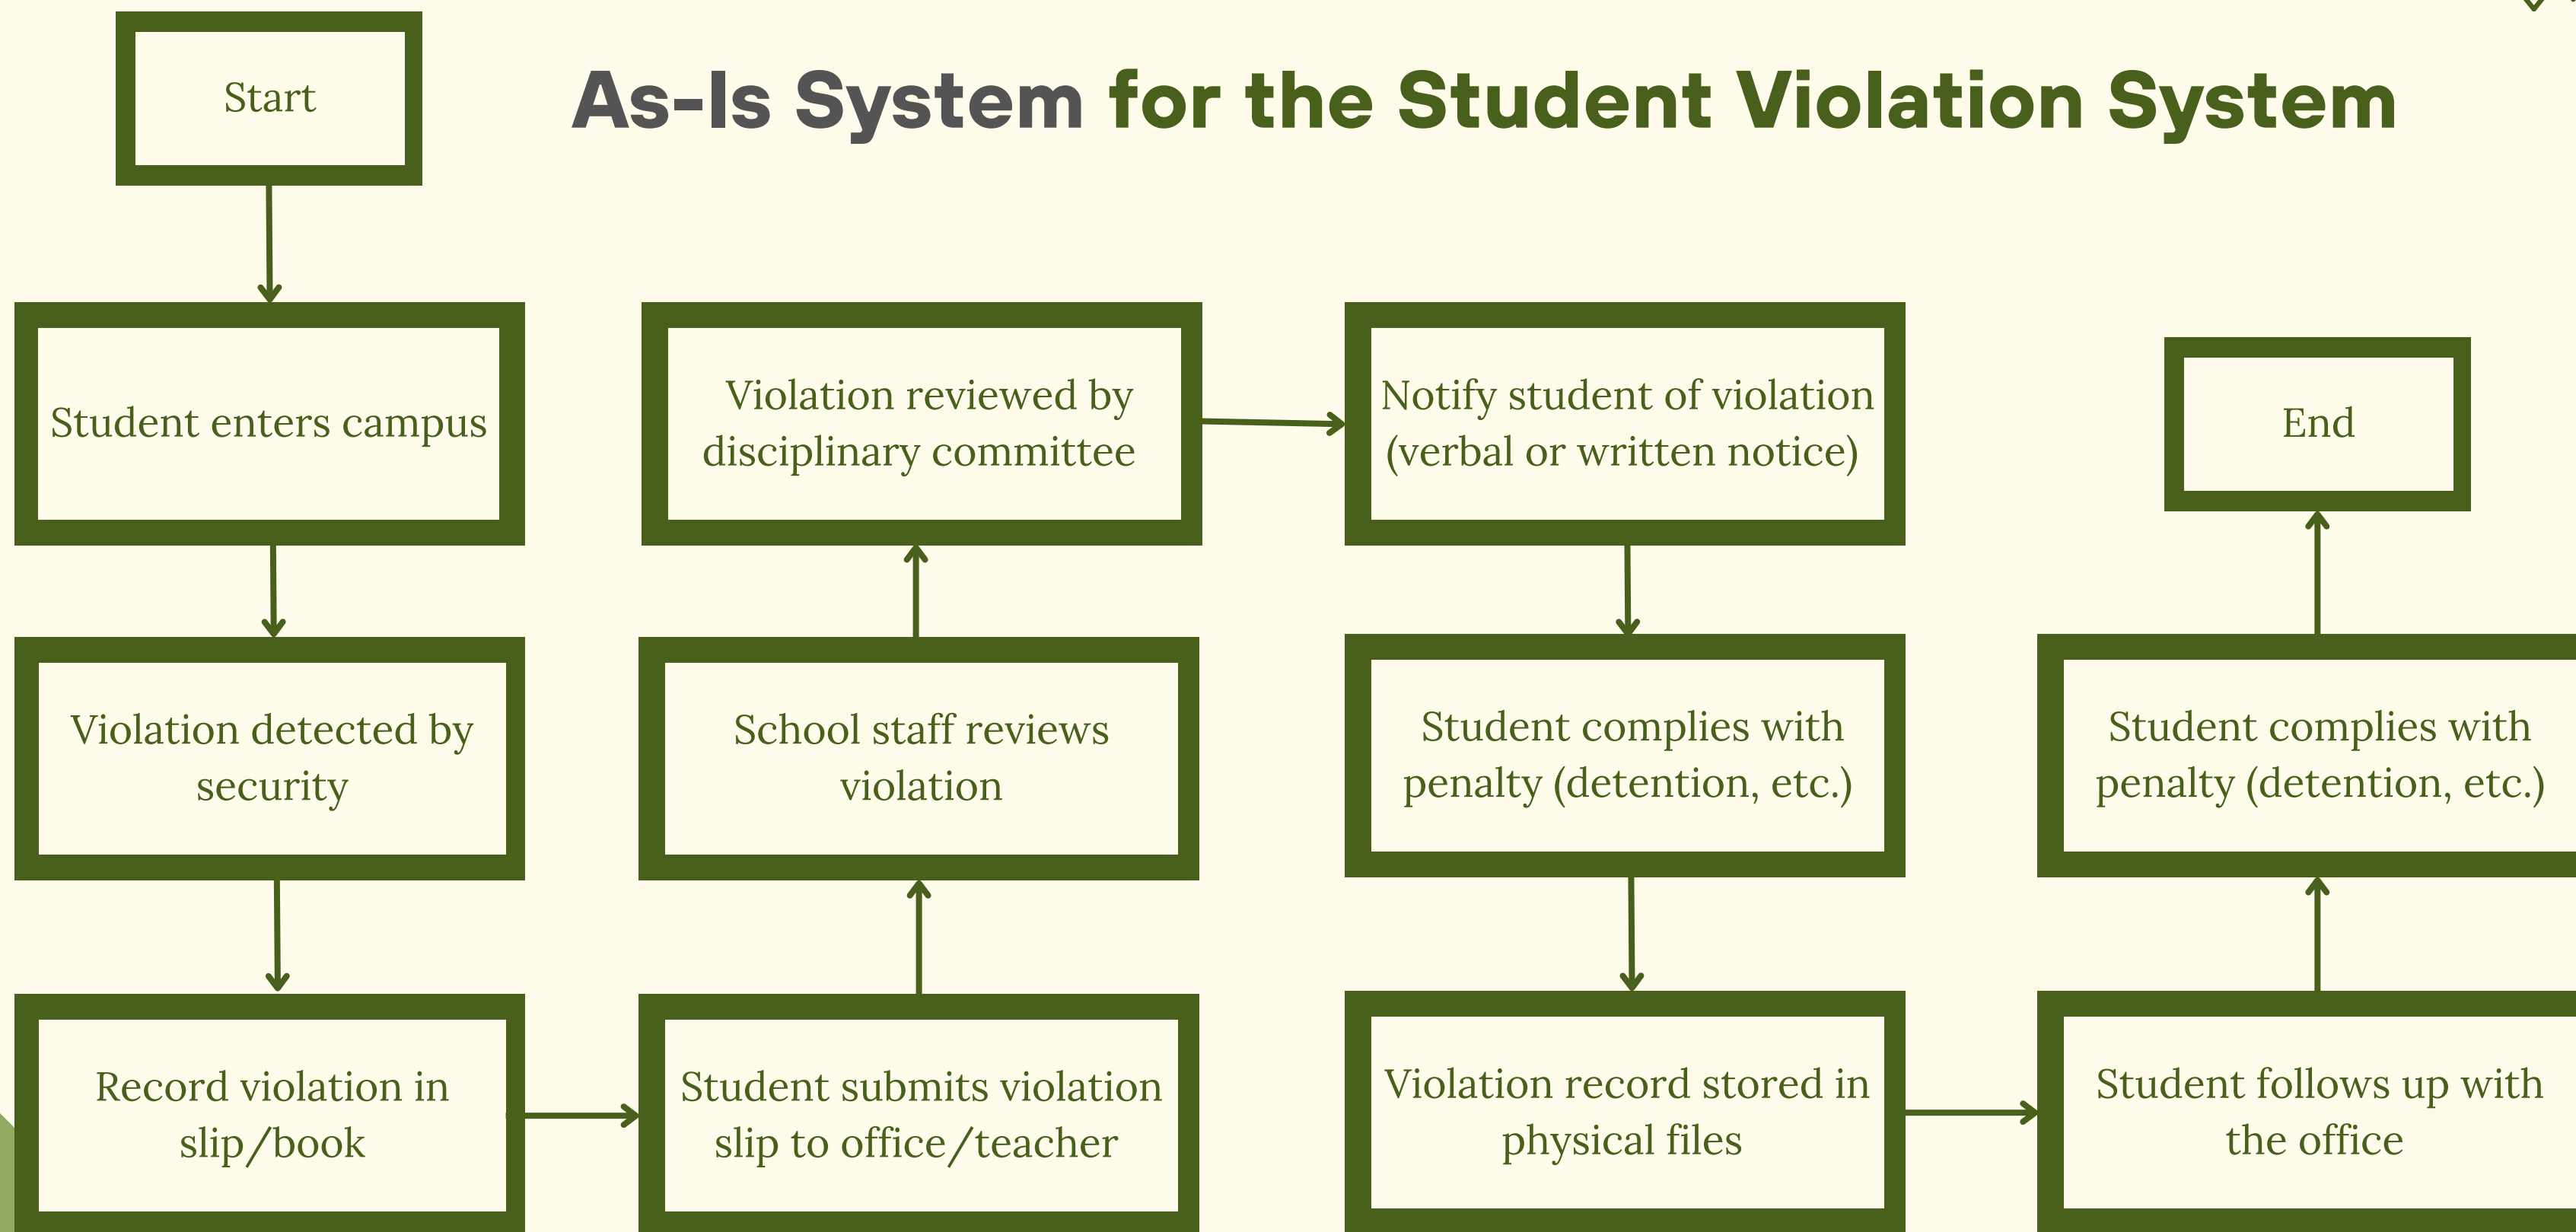

A simple way to manage student violations for
better and faster school processes.

By: Jusalyn A. Gimao

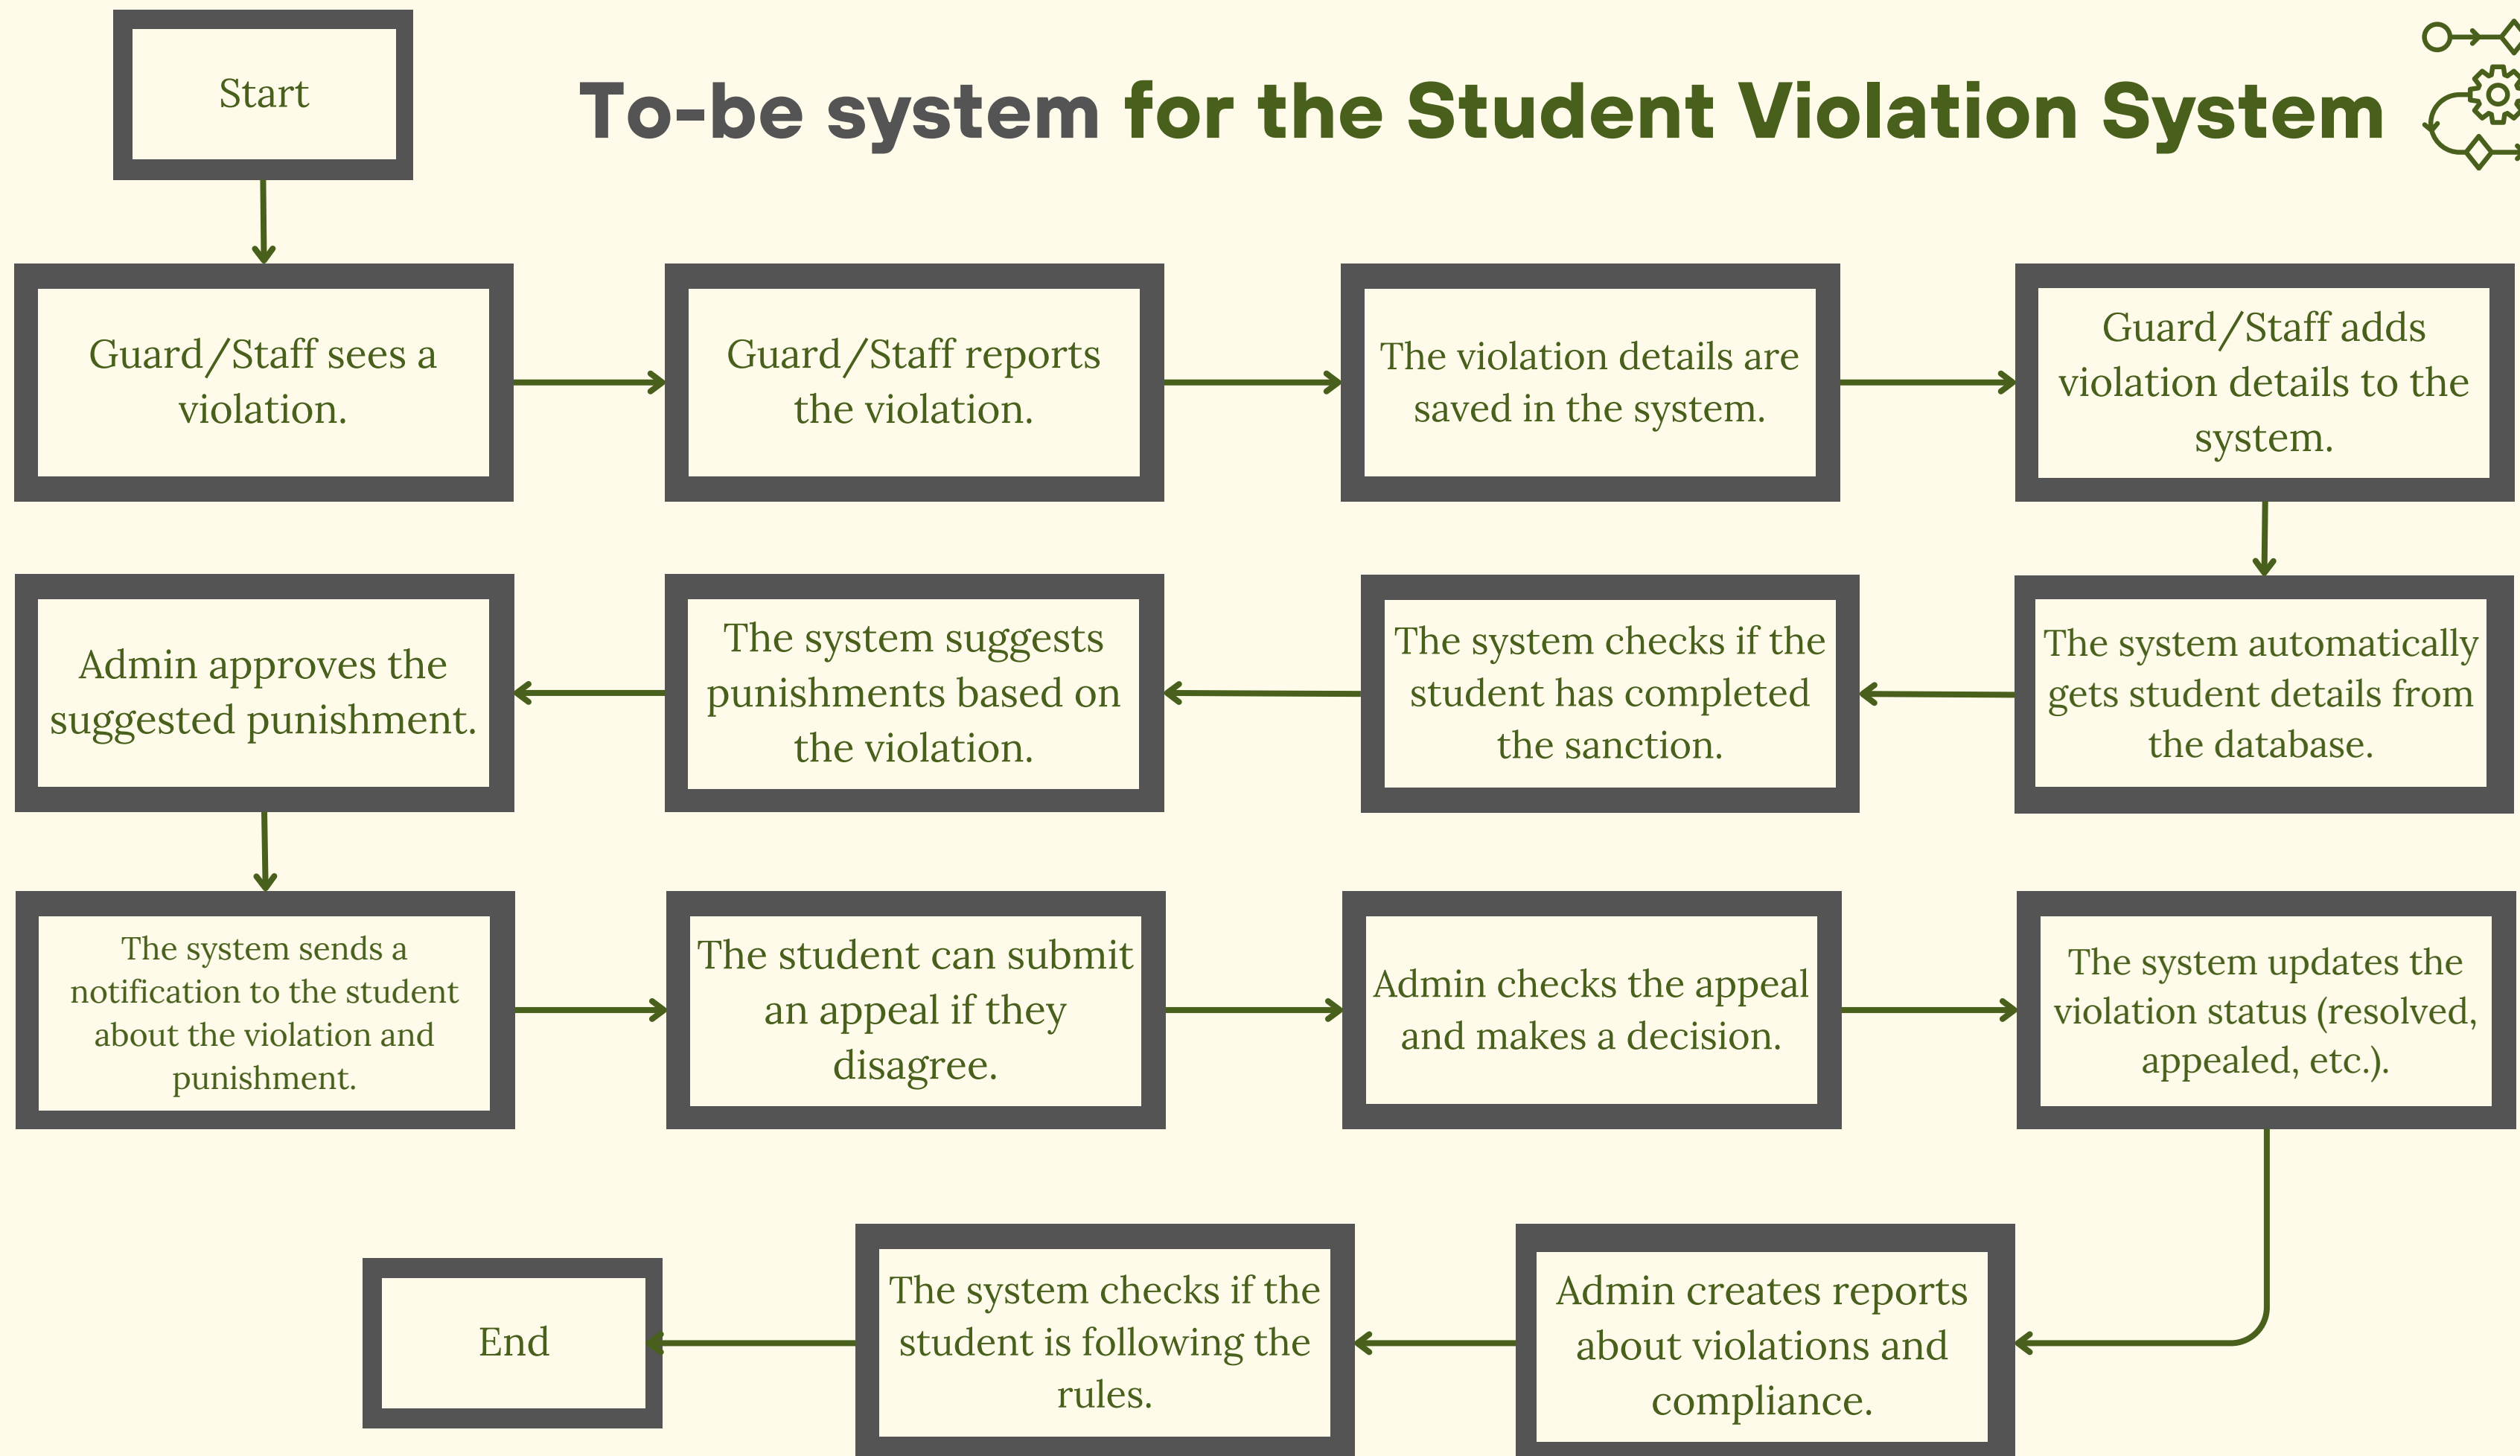

Course: CSC 106 - GP1

As-Is System for the Student Violation System

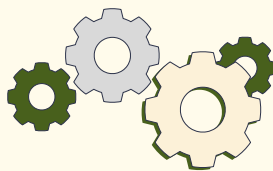

To-be system for the Student Violation System

FUNCTIONAL REQUIREMENTS

Functional Requirement	Description	Example
Scan Student ID	Scans the student’s ID to confirm registration in the system.	A student scans their ID at the entrance to check if they are registered in the system.
Check for Violations	Checks if the student has any recorded violations.	The system looks up the student’s record to see if there are any past violations.
Notify the Student	Sends a notification to the student about their violation, with details such as the date and time.	The student receives a notification about being late to class, including the violation’s time and place.
Student Appeal	Allows students to submit an appeal if they want to contest the violation.	The student sends a message explaining why they were late, with proof like a doctor’s note.
Review Appeal	Reviews the student’s appeal to determine if the violation should be overturned or upheld.	An administrator checks the student’s appeal and decides whether the violation is valid.
Record Final Decision	Records the final decision (whether the violation is upheld or overturned).	The system saves the decision: either removing the violation or adding a warning or penalty.
Track Compliance	Tracks whether the student is complying with the final decision or penalty.	The system updates the student's record once they attend all classes after a penalty is imposed.

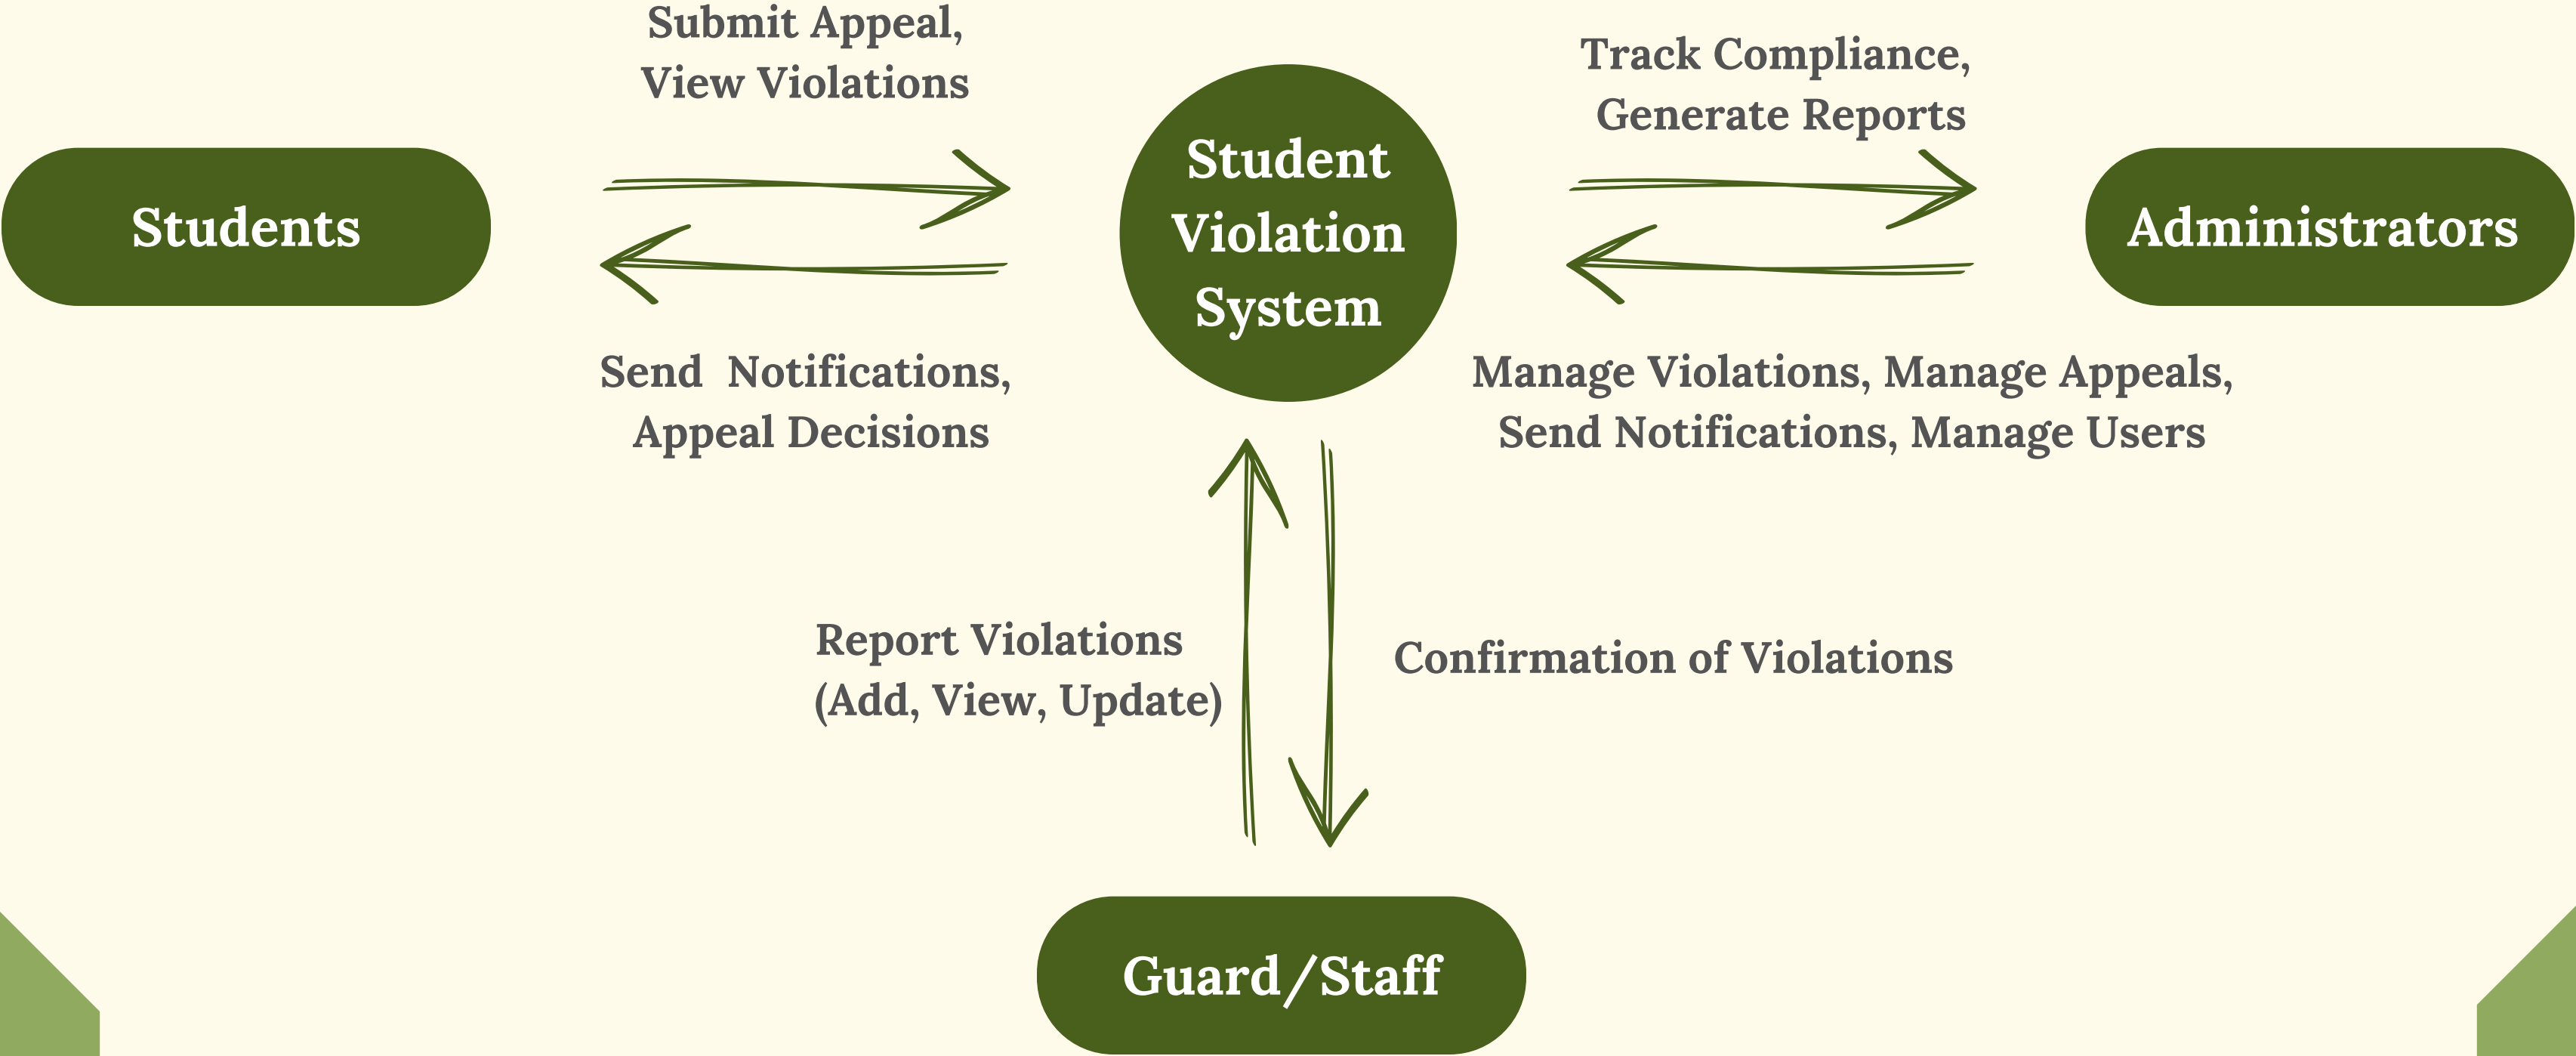

NON-FUNCTIONAL REQUIREMENTS

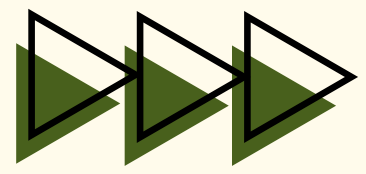

Non-Functional Requirement	Description	Example
Performance	The system should work quickly even with many users.	The system should show student violations in less than 3 seconds.
Scalability	The system should handle more users if needed.	The system should work well with 10,000 students in the future.
Security	The system should keep student data safe.	Only authorized staff can see or change student violation records.
Usability	The system should be easy to use.	Students and staff can quickly find violation details without help.
Availability	The system should be online and working most of the time.	The system should be available 99% of the time.
Backup and Recovery	The system should save data and recover if something goes wrong.	The system can restore data from backup if it crashes.
Compatibility	The system should work on different devices and browsers.	The system should work on Chrome, Firefox, and mobile phones.
Maintainability	The system should be easy to update.	Admins can update records or fix problems without difficulty.
